01

Introduction

The healthcare industry is evolving rapidly, and its needs are changing just as quickly. From research to content creation to digestible communication, there is a growing need to streamline processes for greater efficiency and quality. While the healthcare industry had reservations about AI's adoption, many organizations are now integrating AI in ways that enhance internal operations, streamlining day-to-day tasks without compromising data security or ethical standards.

One area where AI has proven beneficial is in presentation creation. With AI tools, professionals can save significant time on design and content generation and create more impactful presentations by tailoring them to diverse audiences. These tools help simplify complex life-science information, breaking it down into easily digestible parts. This allows experts to effortlessly refine their presentations and devote more attention to their core responsibilities, such as research and strategy development. The result? Enhanced communication effectiveness across the board, enabling teams to deliver clearer, more compelling messages to stakeholders.

In this e-book, we'll explore how leading biopharma companies are using AI to save 50-90% time in the presentation creation process and presenting information in a way that resonates with respective audiences.

02

AI adoption over time in biopharma

AI adoption in the biopharma and healthcare industries has seen significant momentum in recent years. By 2030, the AI healthcare market is projected to reach nearly **\$188 billion globally**, growing from around \$11 billion in 2021 at a compound annual growth rate (CAGR) of approximately 37%.

Healthcare communication spans a complex network of interactions, from internal team coordination to patient discussions and collaborations with external partners. Effective communication at each level is essential for delivering top-notch patient care, fostering trust, and ensuring that critical information is clearly understood and acted upon.

This need for effective communication has led to the adoption of AI in the healthcare sector and it has steadily grown year over year. Generative AI tools are now commonly used in areas such as patient engagement, internal communications, and content generation.

A 2023 Deloitte study found that **73% of healthcare executives** emphasized the role of AI in improving organizational communication and governance. The study highlighted a rise in AI applications for analyzing vast datasets, which helps enhance clarity in communication and accelerates decision-making processes.

Additionally, the McKinsey 2024 survey shows that nearly **60% of healthcare organizations** using AI have reported a positive ROI, primarily in streamlining clinical and administrative communication.

These figures illustrate that AI has not only increased efficiency and convenience but has also substantially reduced costs and grown revenue. With positive ROI reported across many organizations and a promising market forecast, AI is expected to gain even wider adoption in the coming years as healthcare leaders increasingly recognize its value in enhancing both communication and organizational effectiveness.

03

Why biopharma brands are adopting AI for streamlining communication

Communication in the biopharma industry poses unique challenges, as executives are often tasked with presenting complex, technical content to varied audiences, such as healthcare professionals, clinicians, and cross-functional teams. Each group has different levels of expertise, making it difficult to create presentations that are both accurate and accessible. Alex Bitting, Strategy Leader at Alnylam Pharmaceuticals, shed light on the matter claiming that the problem lies in the lack of understanding of these topics as well as their audience.

“Primary challenge is that so few people within the organization understand these topics.”

Many professionals in biotech and healthcare are not trained to create presentations, which can lead to inconsistencies in quality and time pressures when preparing for critical meetings. Presentations are essential to the decision-making process, yet teams often struggle to create polished, brand-aligned slides. Due to budget constraints, many companies can't afford to rely on agencies, and even those with resources often encounter high costs, delays, and unsatisfactory outputs.

“For some of these higher stakes presentations, and by higher stakes, I mean more of these public presentations, we often would have agency support.”

Ben Lei

Head of Marketing at Arcellx

Ben highlights the limitations of agency support, saying, " *“Obviously, that came with a fee. Sometimes the turnaround time could be challenging because you often go through multiple revisions of these slides.”*

These perspectives highlight a common challenge in biopharma: the need for efficient presentation tools that allow teams to focus on core tasks, like data analysis, while ensuring clear, professional communication for stakeholders.

A 2023 Deloitte study found that 73% of healthcare executives emphasized the role of AI in improving organizational communication and governance. The study highlighted a rise in AI applications for analyzing vast datasets, which helps enhance clarity in communication and accelerates decision-making processes.

Additionally, the McKinsey 2024 survey shows that nearly 60% of healthcare organizations using AI have reported a positive ROI, primarily in streamlining clinical and administrative communication.

These figures illustrate that AI has not only increased efficiency and convenience but has also substantially reduced costs and grown revenue. With positive ROI reported across many organizations and a promising market forecast, AI is expected to gain even wider adoption in the coming years as healthcare leaders increasingly recognize its value in enhancing both communication and organizational effectiveness.

AI is solving these issues by simplifying and automating the presentation creation process. Advanced AI technologies like **ASTRID**, which power Present's capabilities, consider audience empathy to ensure that presentations convey key information and resonate with the audience. With these power tools, teams can quickly generate industry-tested, executive-tailored presentations that are aligned with audience needs, brand elements, and business objectives.

Create a 4 slide presentation on a pharmaceutical e-learning platform for healthcare professionals.

Generate

Outcomes: Huntinnox improved motor function, had a favorable safety profile, improved quality of life, and reduced healthcare utilization

present.

What's Next: Next steps include continued RWE studies to optimize Huntinnox use

Strategy: RWE studies complement clinical trials

04

AI-driven time savings in presentation creation

Time constraints are a significant challenge for professionals, especially in healthcare communication, where creating effective presentations often becomes a time-consuming task due to various factors like:

Lack of specialized training: Scientists and healthcare professionals are experts in their fields but are typically not trained in presentation design, leading to inefficient processes.

Multiple demands within tight deadlines: Teams are often tasked with preparing numerous presentations in a short time for various stakeholders, increasing the complexity.

Complex information to simplify: Communicating intricate medical data in a concise and understandable format, tailored to different audiences, adds significant pressure.

Why presentations are time-consuming for healthcare professionals

Lack of specialized
training

Multiple demands
under tight deadlines

Complex information
to simplify

AI is solving these issues by simplifying and automating the presentation creation process. Advanced AI technologies like **ASTRID**, which power Prezent's capabilities, consider audience empathy to ensure that presentations convey key information and resonate with the audience. With these power tools, teams can quickly generate industry-tested, executive-tailored presentations that are aligned with audience needs, brand elements, and business objectives.

AI revolutionizes this process for medical professionals by providing tools that drastically reduce the time and effort required to create presentations:

Pre-designed templates: AI offers access to brand-consistent, professional templates that simplify design.

Automated content generation: AI systems can quickly draft text or visuals based on data inputs, minimizing the time spent on content creation.

Quick customization: With AI, presentations can be easily personalized to suit specific audience needs, ensuring that complex information is delivered effectively to different groups.

These AI capabilities contribute to time savings of 50-90%, which translates to higher productivity and improved outcomes across the organization.

05

A Fortune 100 biotech company case study

Bill Cleary, Strategic Planning and Operations Lead at a Fortune 100 biotech company encountered significant challenges in efficiently creating presentations. The team was spending excessive time on presentation design, leading to delays and impacting the clarity and timeliness of decision-making. Cleary noted:

“Usually you were limited to few resources. My team’s challenges were around how to get started with being able to communicate those messages. There's a myriad of different ways that you could go in how to present and being able to work through how to break through that inertia.”

After implementing Present’s AI-powered tools, Cleary’s team saw a transformative shift, reducing presentation preparation time by 80-90%. The platform’s intuitive features eliminated the hesitation of “Where do I begin?” and provided an extensive library of presentation templates and visuals, allowing for quick, high-quality customization.

Present’s AI platform empowered the team to focus on strategic content and improved the impact of their communications.

“The time to develop presentations went down significantly. My team easily saved 80 to 90% of time and cost. A quick search in Prezent brings a plethora of options that you're able to choose from, download, and start to build.”

06

Improving communication efficiency and effectiveness

Critical business units in biopharma, such as oncology, rely heavily on extensive clinical trials and research. Clear, effective communication is essential for the success of these high-stakes projects. However, biopharma professionals like scientists, analysts, and healthcare experts, often face the challenge of presenting complex scientific and technical data in a way that's accessible to non-technical audiences. Many of these experts aren't trained in presentation design, which can make it even harder to translate dense information into structured, impactful slides for stakeholders. As a result, even with significant time and effort, presentations may sometimes fall short of making the intended impact.

The business communication process needs to be optimized to drive successful outcomes. This means tailoring messages to resonate with diverse audiences, ensuring consistency across teams, and using visuals that clearly convey data insights. This approach fosters alignment, supports informed decision-making, and ultimately accelerates progress in critical areas like drug development and other initiatives that prioritize patient well-being.

AI is transforming how teams convey complex details by automating previously time-consuming tasks, reducing both labor hours and costs. Here are some ways AI is making a difference:

Targeted, relevant messaging: AI platforms enable the delivery of tailored information, helping teams create presentations that effectively address the specific needs of their audience. By incorporating relevant visuals, AI tools convert complex data into digestible formats, making it easier for all stakeholders to grasp critical insights.

Real-time collaboration: AI tools offer real-time editing and feedback features, allowing team members to contribute their expertise directly to the presentation. This encourages collaboration, fosters a sense of ownership, and ensures that different perspectives are integrated into the final output.

Consistent and aligned messaging: With predefined templates and brand guidelines, AI-driven platforms help teams maintain consistency across presentations. This consistency strengthens brand integrity and allows team members to produce aligned content without needing to start from scratch.

By integrating AI into their communication processes, biopharma companies significantly enhance impact while ensuring consistency across teams.

07

GBT case study

Maurice Garland, former Vice President of Sales and Market Access at Global Blood Therapeutics (GBT) encountered substantial productivity losses and financial drain due to communication gaps, extensive time spent on presentation creation, and high agency fees. Reflecting on these challenges, Maurice noted:

“We spent a lot of time building PowerPoint presentations and trying to share information that way. We had numerous templates that we built to try to share this information, but there was no single version to share this information in an effective way.”

Recognizing the need for greater efficiency and consistency, Maurice adopted Present's AI-driven solution to standardize communication. This approach not only cut down the presentation development time but also significantly reduced the team's reliance on external agencies.

“The biggest benefit of using Prezent is that now we have a communication platform that allows us to tell a story and share complex information in a way that is easily received and that comes across with tremendous executive presence. We cut down lost productivity by about 50% and probably saved 20–25% just in the agency budgets.”

Maurice Garland

former Vice President of Sales and Market Access
at **Global Blood Therapeutics (GBT)**

20-25%
Reduction in agency cost

Enhance impact, effectiveness, and
consistency in business communication.

Elevated brand awareness and
recognition in the biopharma industry.

08

Enhancing decision-making with AI

Effective decision-making relies heavily on the timely presentation of relevant information. AI is transforming how organizations approach this by equipping them with tools that help deliver the right details to the right audience. Here's how AI facilitates better decision-making:

Personalized information delivery: AI platforms present relevant information tailored to the needs of specific audiences. By analyzing user preferences and past interactions, AI ensures that decision-makers receive insights that matter most to them, making it easier to absorb complex information quickly.

Insightful visualizations: AI enables the delivery of insights through effective visualizations, transforming raw data into clear, digestible formats. This helps stakeholders understand key trends and patterns at a glance, facilitating quicker and more accurate decisions.

Improved team coordination: AI enhances collaboration among team members by providing tools for seamless communication and project management. This ensures that all relevant parties are involved in the decision-making process, allowing for diverse perspectives and more comprehensive solutions.

AI's hyper-personalization capabilities ensure that relevant information is presented to the decision-makers, preventing them from feeling overwhelmed or confused by an excess of data. By delivering only the most pertinent insights in an effective manner, the decision-making process becomes significantly faster and more accurate.

3 Key features of effective presentations for timely decision-making

Relevant and actionable insights :

Help decision-makers focus on key takeaways and next steps.

Right visualization of the data : Maintain attention and enhance information retention, speeding up the decision-making process.

Clarity and focus : Eliminate confusion and ensure decision-makers quickly grasp essential points.

09

Case study of a Fortune 500 biopharmaceutical company

Scott Rosania, Senior Director of Patient Customer Services at a Fortune 500 biopharmaceutical company, plays a key role in understanding patient experiences and analyzing program insights. His team's responsibility is to deliver accurate, relevant information to executives to secure support for initiatives that put patient well-being first. Scott's challenge is to present this complex data in a way that resonates with different audiences, ensuring he gains their backing for the team's projects.

He describes the challenge of this process:

"There are a number of different audiences I have to sell the narrative down to make sure that I'm gaining buy-in from the team that's going to support all of the great initiatives that we want to accomplish. If I can't effectively communicate my needs, my messages, and my narratives to leadership, the funding dries up, and we'd be unable to support our patients."

Prezent's AI-driven '**Fingerprint**' feature enables him and his team to make presentations more tailored to leaders they might not be familiar with, thereby facilitating clearer and more effective communication. This tool has simplified the process of conveying complex data visually, making their slides both professional and accessible, and saving them considerable time.

“With Fingerprints, you answer the questions so you understand who you are as a presenter and your audience. Since there has been a wider adoption of using Prezent in the company, the Fingerprints help when speaking to leaders I may not have known previously.”

Scott Rosania

Senior Director of Patient Customer Services
at a **Fortune 500 biopharmaceutical company**

Time-saving:

Enhanced efficiency
helped save 70%
of the time

Improved quality:

Pre-designed
templates improved
presentation quality.

Cost reduction:

Inhouse capability
helped us reduce
agency cost by 30%.

Brand alignment:

Prezent ensured
consistency across
all presentations.

10

Effective storytelling in biopharma

Before exploring the challenges of storytelling in the biopharma industry, let's consider an intriguing fact: the human brain is **22 times** more likely to remember facts when they're presented as part of a story. This underscores the power of storytelling in communication.

Adding to this, research by the London School of Business reveals that people retain only **5% to 10%** of information when it's presented as raw statistics. However, when the same information is woven into a story, **retention jumps to 65% to 70%**.

The power of storytelling

22X

higher probability
of remembering facts

70%

higher information
retention

In the biopharma industry, storytelling is a unique challenge, requiring the seamless integration of narrative and the science of medicine. While complex, effective storytelling is crucial for engaging audiences and conveying complex information. Here are some of the challenges that professionals face in effective storytelling:

Technical jargon: Biopharma professionals often encounter complex scientific concepts and medical terminology. Crafting a narrative that communicates these ideas to different audiences demands a deep understanding of both the subject matter and the audience's expertise level.

Diverse audiences: Storytelling must resonate with diverse stakeholders, including researchers, clinicians, regulatory bodies, and patients. Each group has unique needs and perspectives, making it challenging to create a cohesive narrative that appeals to everyone.

Regulatory constraints: The heavily regulated nature of the biopharma industry limits storytelling methods. Professionals must navigate compliance and ethical considerations while engaging their audience, adding complexity to the storytelling process.

Data integration: Effective storytelling often relies on data to support claims and insights. Integrating complex datasets into a compelling narrative can be challenging, especially when aiming to simplify the information without losing its significance.

Despite these challenges, storytelling remains essential in biopharma. Research indicates that narratives can significantly boost understanding and information recall, making them invaluable for effective communication.

Barriers to effective storytelling in the biopharma

Complex and technical content

Highly technical and scientific data can be difficult to simplify for diverse audiences.

Regulatory and compliance constraints

Strict regulations can limit the freedom to craft compelling narratives.

Diverse audience needs

A lack of understanding of the audience's needs creates difficulty in crafting a good narrative.

Lack of skills

Lack of training in communication leads to failure in connecting with the audience.

11

GBT case study

Gwen Whitney, former Vice President of Commercial Operations and Market Access at Global Blood Therapeutics (GBT), and her team faced a significant challenge: transforming complex data into engaging narratives that resonated with various stakeholders. While they excelled in data analysis, communicating the value of their insights effectively often proved difficult. As a result, they spent more time on slide creation than on their core analytical work.

Reflecting on the challenge, Gwen shared:

“We were not a communications team. So the time we were putting into making slides, coming up with the story, and trying to communicate to key stakeholders effectively was a heavy lift. It often took more time than the work itself, and it was really inefficient for us”.

Prezent transformed the way Gwen and her team approached presentations. They were able to create personalized content and present information in a more structured way. This effortless ability to deliver technical and data-heavy slides with engaging narratives added depth and impact to their presentations.

“The Story Builder feature in Prezent brought immense value to our team, shifting our focus from simply presenting data to crafting compelling narratives. It guided us in structuring stories effectively, ensuring a clear and coherent message from start to finish in our business communications”.

Gwen Whitney

former Vice President of Commercial Operations and Market Access at **Global Blood Therapeutics (GBT)**

Efficiency Impact

Reduction in time spent on packaging and communication tasks by over **50%**

Cost Savings

Significant cost savings due to decreased reliance on external vendors.

Effectiveness

Increase in time allocated to data analysis and research from less than **20% to 80%**.

12

Best practices and future trends

The scope of Generative AI in the biopharma and healthcare industry is vast, with significant potential to transform medical communication processes. According to [McKinsey's 2024 report](#), generative AI has the potential to significantly streamline the creation of technical and scientific documents, such as medical information responses, reports, and stakeholder communications. The report estimates that this technology can reduce medical-writing costs by 20-30% initially, with potential savings of 50-70% as the systems become more advanced and widely adopted.

Generative AI is also making significant progress in the presentation space. Its ability to make it easier for teams to communicate scientific findings, regulatory updates, or clinical trial results effectively. By leveraging pre-designed templates and auto-generated content, AI tools can cut down the time needed to craft high-quality presentations by up to 90%. This not only ensures brand consistency but also allows researchers and executives to focus on more critical tasks, such as developing new therapies or engaging with stakeholders.

AI systems have already matured to an extent where they are able to handle repetitive tasks like formatting and personalizing presentations for different audiences. [Communication Fingerprint](#), for example, is a feature developed by Prezent. It can impressively define the needs and preferences of the audiences, providing details on their visual likings, data preferences, and even storytelling styles. These actionable insights help the professionals to tailor the presentations to the audience's needs.
